Sitemap (Structure & Navigation) Key Features

All pages have consistent navigation bar that allows the user to navigate back to index.html (Home) page.

Responsive Navbar | **Return to Home <a>** | **Footer links via graphical icons.**

Home
index.html

- Responsive Logo (XL) contains rainbow gradient effect on :hover.
- Bold statement to attract user to interact with the site.

About
me.html

- About me that provides a small in-site to who i am and what i love to do.
- Small bite size snippet of my interests and hobbies.
- Hero image.

Experience
experience.html

- Bold heading.
- Languages & Tools- includes icons.
- Button link to what i'm working on.
- Hero skills that potential employers need to know.

Blog
journey.html

- Why i'm learning to code.
- Blog post snapshots that allow the user to click to view more. This will link to external html documents with return to previous page link.

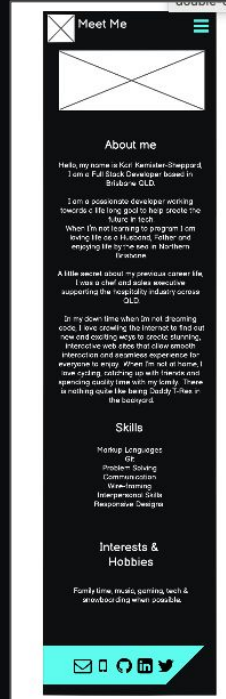

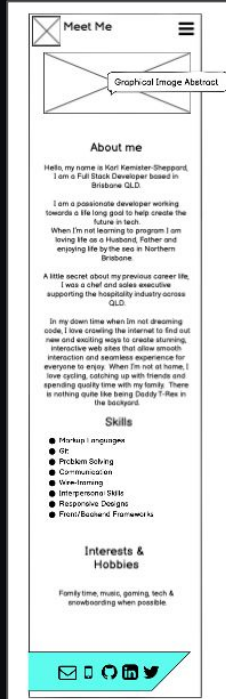

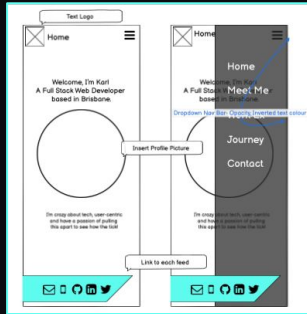

Contact
contact.html

- Form containing text input fields and submit button that is linked to form submit external server to FWD to personal email.
- All fields are set to required to ensure all inputs are completed.

Mobile + Small Devices Landscape

MOBILE + SMALL DEVICES- OVERVIEW

All pages have consistent navigation bar that allows the user to navigate back to index.html (Home) page.

Responsive Navbar | Return to Home <a> | Footer links via graphical icons.

Home
index.html

First concept wireframes for the homepage consisted of hamburger dropdown, graphical image and cropped footer. I realised my skill set in building a navigation bar with JS was currently out of reach.

Changes were made to the layout, replaced the img with LOGO added :hover affect + flexbox properties to create stacked column navbar for UX.
@media Q **added** to fit desired screen display sizes.

About
me.html

First concept wireframes replicated the hamburger dropdown, graphical image and cropped footer as well. The new improved revision seen this feature scrapped and replaced with main content as first priority followed by hero image to allow users to feel connection with myself on a more personal level after reading the about me..

Navbar was set to display : flex and position: fixed to ensure header sat on top of the page at all times.

Experience
experience.html

First concept wireframes followed a simple structure ect ul-li style. After learning new way and creating blog containers- i transferred the theme into this section of the document to transfer common themes across the site eg color, borders (radius).

In addition, adding **color icons** for the languages that will be learnt before the end of the Bootcamp.

Blog
journey.html

First round if wireframes where designed around UX- simple clean design that allow the user to click on a read more button to navigate them to a individual html page containing the higher details for the blog including images ect.

Scss style properties have been added to each element with use of classes and divs to help contain individual styling or flex properties. To achieve the desired visuals.

Contact
contact.html

The contact page uses different elements such as **input**, **action** and **submit** functions with the addition of the added "**required**" **call** to ensure the document cannot be submitted without all fields being completed.

The form submit button talks to formsubmit.co and retrieves the completed details and sends them directly to the designated email address you input.

SCSS styling added with :hover pseudo functions also to enhance UX.

2022-03-13 Basic Terminal Create your first file directory

Lets have some fun creating
your first directory folder in
Terminal

Open Terminal on your Mac

```
1 $ cd
```

Lets make sure your in the
correct directory by typing pwd,
this will show you the current
working directory you are sitting
in.

Once your in the correct
directory, type the following
mkdir folder name and hit enter

```
1 mkdir myNewFolder
```

Now lets use check that we have
completed the command by typing
ls as seen below, we have
created the new directory

```
1 ls
myNewFolder
```

Congrats!! you have made your
first directory using Terminal

Extra Learning

Now lets create your first .txt
file.

We do this using the
touch command by using then type
touch txt and hit enter

```
1 touch myNewFolder.txt
```

Well Done!!!

2022-03-13 Basic HTML Create your first class

Lets have some fun creating
your first class so you can start
using CSS

Lets start off by creating a
basic HTML skeleton as per our
last session

To create a class we need to wrap
it in something we call a (div),
we will cover this off in another
blog subject, but for now lets
do some coding.

Now that we have the div created
we get below lets get into adding
the class. We call the below
function class="" as below to
create the class. The
represents the name you will give
the class as you can identify the
class for your ready to style the
class with CSS.

```
1 <div class="myNewClass">
2   <h1>My New Class</h1>
3 </div>
```

Now you have added the class, the
most important part to to ensure
you close the div > to the action
can be completed.

Congrats, you have just made your
first class and you are nearly
ready to dive into CSS or SASS
SCSS.

2022-03-13 LEARNING HTML Setting up basic HTML Document

Let get started by creating your
very first html document using
basic two key strokes

```
1 <!DOCTYPE html>
2 <html>
3   <head>
4     <meta charset="UTF-8">
5     <title>My New HTML Document</title>
6   </head>
7   <body>
8     <h1>My New HTML Document</h1>
9   </body>
10 </html>
```

Create a new document and give it
a name index.html (click save)

One the first line hold shift+I
(!) then hit [tab]

Congrats you have just learned
the first step in getting
started.

2022-03-13 Basic HTML Create your first image link

Lets get you started by creating
the directory folder [img]

```
1 > docs
2 > ppt
3 > src
4 > img
5 > SCSS
```

Start of by creating a new
directory and giving it a name of
img (this will be a container for
all the images you add to the
site)

Once you have created the
directory simply drag or import
the .jpg/png file into the
folder

Now lets get the image onto the
page!!!

To create a link you need to
create a tag to wrap the image,
the tag only needs to be closed
with a </>

Now lets code, and the below
inside the body tag

```
1 <img src="" alt="yourimage.png" />
```

Make sure your wrap it with a < and
it here >

Congrats, you have added your
very first img to your site

2022-03-13 Learn CSS Link a CSS stylesheet to your HTML Document

Lets have some fun creating
your first stylesheet so it can
talk to your HTML documents.

Lets start off by creating a CSS
directory inside your project file

Now you have done that, lets
create a new file called
style.css

Here is the most important
function we need to execute.
<link rel="stylesheet"
href="style.css"> make sure you
open and close it with < > tags
to make sure it is called.

If your HTML looks like the above
you are halfway there.

I want you to add your own
styling font-size: xct and hit
refresh...

Now you are on your way to
becoming a little tech guru!

```
1 <link rel="stylesheet" href="style.css">
```

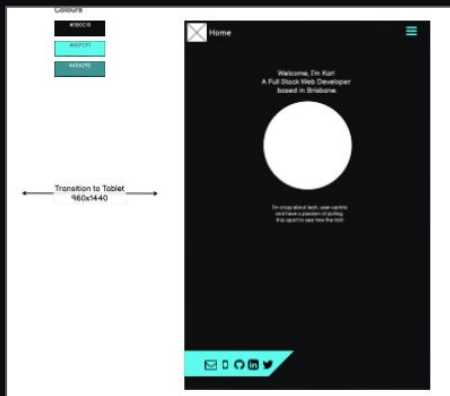

Well Done!

TABLET- (WORKINGS)

Tablets- Medium Size

(min-width: 769px) and (max-width: 992px)

Transition to Tablet
460x1440

TABLET- OVERVIEW

All pages have consistent navigation bar that allows the user to navigate back to index.html (Home) page.

Responsive Navbar | **Return to Home <a>** | **Footer links via graphical icons.**

Home
index.html

Initial concept was binned and replaced with clean version transferred from the mobile version.

Added multiple @media Q to make components more visible to the user whilst keeping ratio within preset @mixin presets for the page container margins.

About
me.html

Initial concept in regards to layout is similar, with inherited features as per the new design.

Extra margins added and font-size scaling improved responsiveness such as rem.

Experience
experience.html

Initial concept in regards to layout is similar, with inherited features as per the new design.

Container **added** to contain the icons from the original concept with the addition of the read more button to give the user more info on the subject via **click**.

Blog
journey.html

Added **Media Queries** to adjust the content of the blog containers for visual UX.

Reduced the original border weight as the first pass was too heavy and caused the user to strain their eyes.

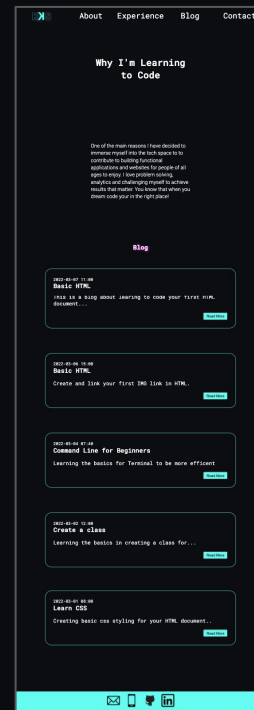

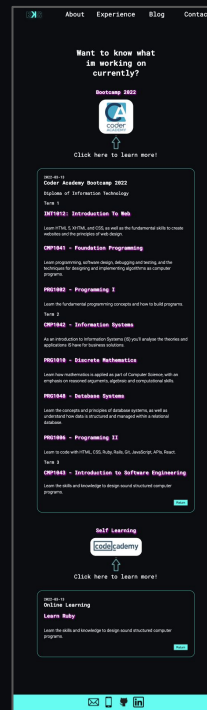

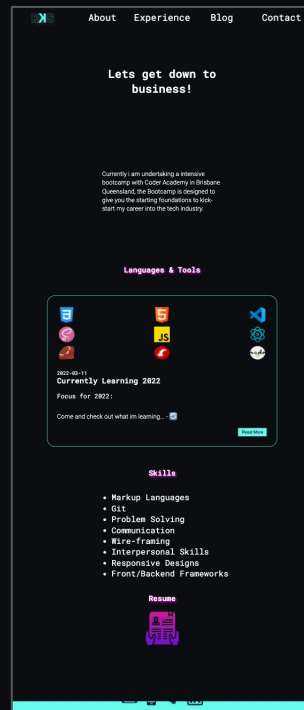

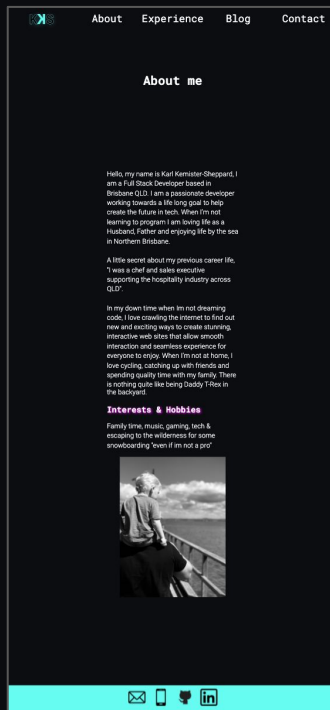

Increased rem size.

Contact
contact.html

Increased **rem size** on font-size.

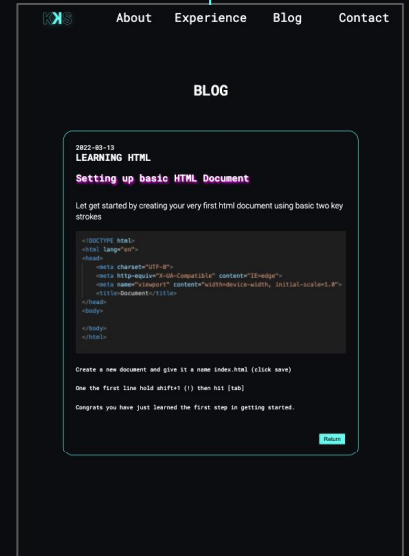

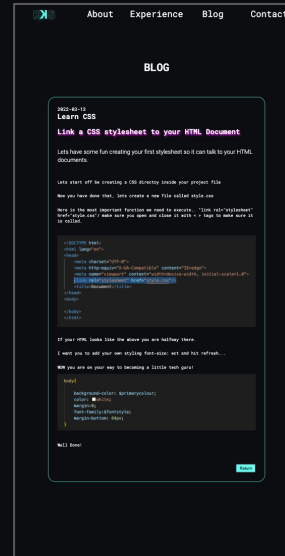

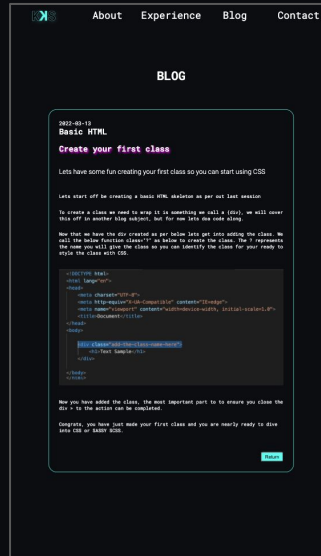

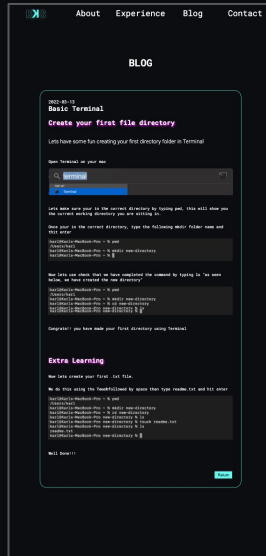

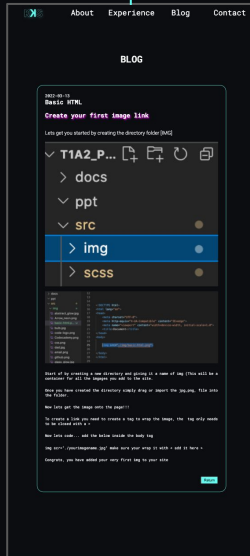

Adjusted the blog container to adjust to the screen size and **adjusted the size** of the submit button to give the user a better line of site.

TABLET WIREFRAMES- FINALS

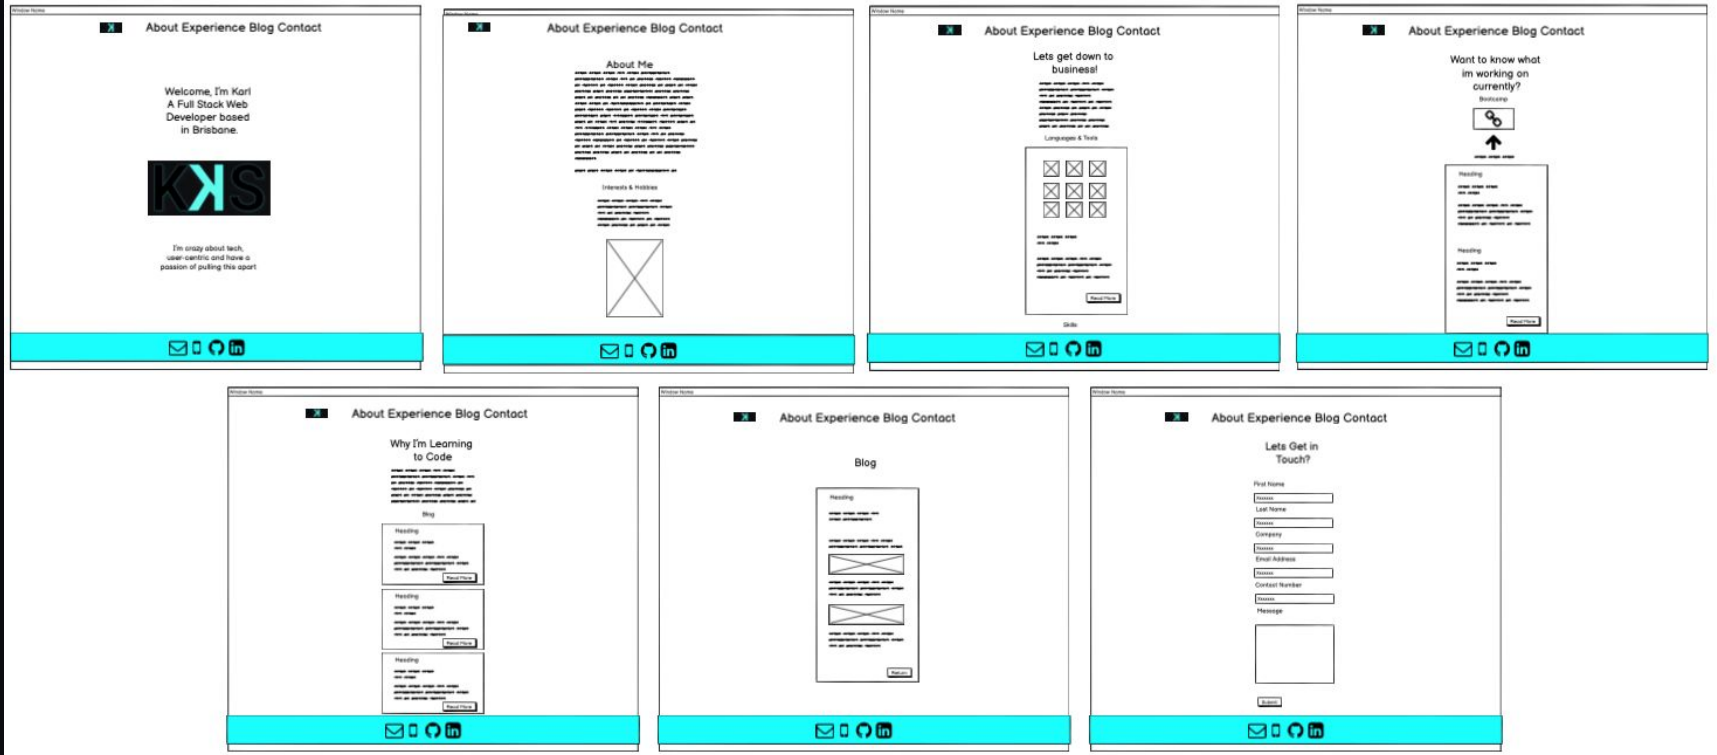

TABLET WIREFRAMES- FINALS

BLOG

DESKTOP- (WORKINGS)

Desktop- Large Devices
(min-width: 993px) and (max-width: 2500px)

DESKTOP- OVERVIEW

All pages have consistent navigation bar that allows the user to navigate back to index.html (Home) page.

Responsive Navbar | **Return to Home <a>** | **Footer links via graphical icons.**

Home
index.html

First concept wireframes where aimed at having the breakpoint change the Flexbox (flex-direction) to column, but after deciding to simplify the landing page i decided to keep the same feel when you land on all devices.

Main change was to change the direction of the navigation bar to sit in row rather than column as in previous display presets

About
me.html

Amended the FlexBox properties to change the NavBar back to row (flex-direction) row, to ensure the NavBar increases the viewport for the UX.

Rem font-size adjusted to adjust to the new viewport size.

Experience
experience.html

Amended the FlexBox properties to change the NavBar back to row (flex-direction) row, to ensure the NavBar increases the viewport for the UX.

Rem font-size adjusted to adjust to the new viewport size.

Blog
journey.html

Further adjustments made to the rem for all font-sizes to ensure readability.

Adjusted container width and margins to align the content to compensate for increased view size so the user doesn't have to read screen edge to edge.

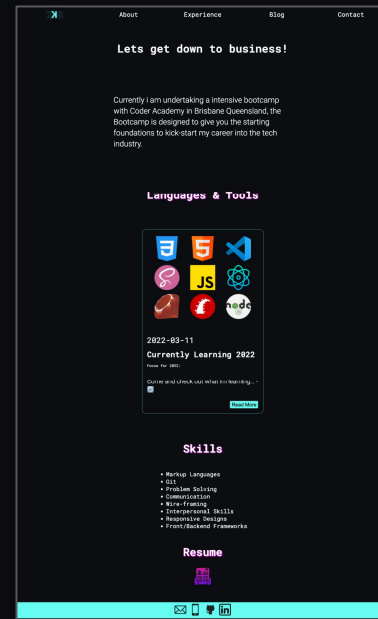

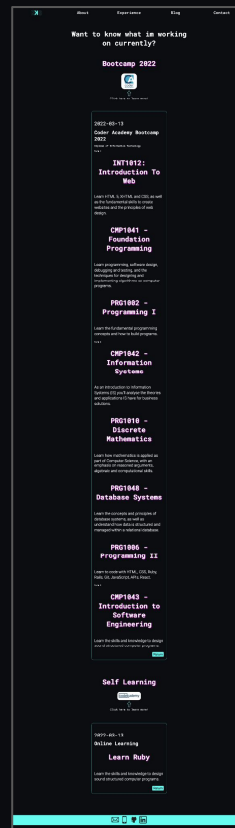

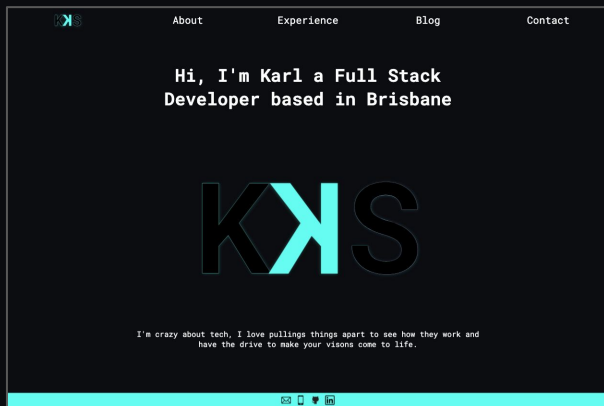

Contact
contact.html

Font-size for all texts adjusted to fix screen viewport.

Reduced form width to be more central to the page content.

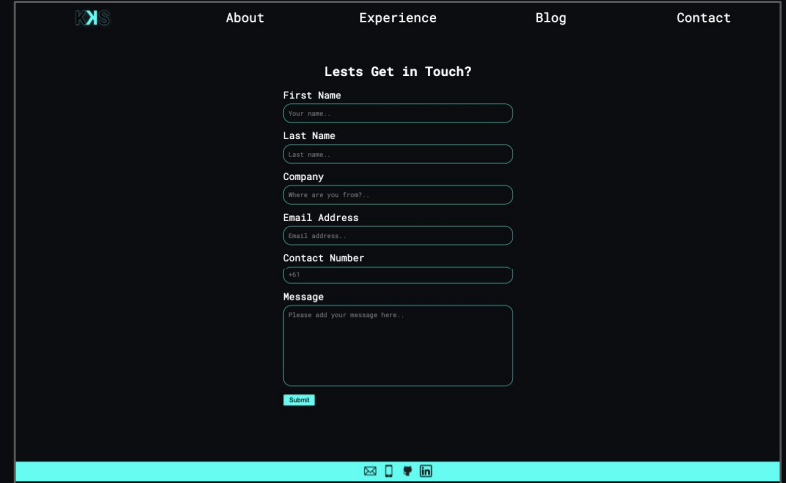

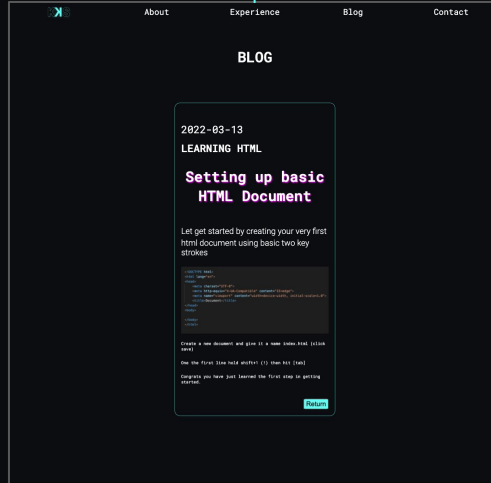

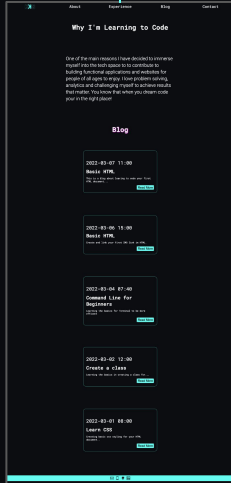

Increased button size.

Components Breakdown

List of Components used in the Website - Styling & Audience

Navigation Bar

Navigation bar is designed to help the user navigate through the website- with the addition of return to home logo. Nav bar is set to fixed position to ensure the user can quickly change pages without excessive scrolling.

Features include pseudo :hover state. Flexbox positioning properties to give the user 2-3 main viewport layouts depending on their device size.

Footer Bar

Footer bar is styled to be bold, vibrant and clean. Pseudo :hover scale properties have been added to clearly identify when pointer is hovering over the icon <a> link.

Flexbox styling added to center align the icons inside the footer bar so it scales based on the display size.

Each icon links directly to Email, Phone, GitHub & LinkedIn

Logo

There are various Pseudo :hover properties added throughout the website to give the user a fun and exciting experience whilst navigating the site.

Eg. When the hover function is initiated- the blog container activates a box-shadow and increase the container size and emits neon purple glow.

Components Breakdown

List of Components used in the Website - Styling & Audience

Icons Anchors

<a href> tags have been added inside the header, footer, blog containers to improve site navigation and user experience.

They have been styled with scss (sassy) positioning executed with display flexbox and standard css properties.

Contact Form

Added basic contact form to allow the user a simple yet effective way to get in touch.

Sassy styling has been applied to the parent container to ensure it follows the website theme.

Required setting applied to all inputs, and connected the form submit button to formsubmit.co to connect endpoint to fwd the email directly to designated email address.

Buttons

The site has various <button> tags throughout the website. These are places specifically in sections where the user can click to “read more”.

This option allows the site to retain a slim visual look, but offers the user the option to expand or navigate the document content if they wish to read more.

Review

General overview- The development process was challenging yet fun and addictive. I found myself pushing the boundaries to learn more effective ways to execute the commands i wanted to achieve based on my current understanding of the concepts and processes i wanted to achieve throughout the design and development stages.

Challenges

Creating **hamburger** navigation menu- complex process for current skill level. Nil understanding of **JS** functions and how it works.

Flexbox- Understanding when to call display flex and set properties on the parent container. This required additional support and further training using online tutorials.

Ethical issues

Limited issues in relation to user **privacy and security** as the site only contains a contact form that when completed sends their private details to the site owners designated email address.

Highlights

Logo- Vibrant, fresh & Energetic

Box Containers (Blog)- Excitement

Responsive website that works on large variety of display screens.

Color palette chosen emits a trustworthy, calming, young and energetic energy to the user.

THANK YOU
